Civilized Violence May 15 2021 Civilized Violence provides a social and historical explanation for the popular appeal of cinema violence. There is a significant amount of research on the effects of media violence, but less work on what attracts audiences to representations of violence in the first place. Drawing on historical-sociology, cultural studies, feminist and queer theory, masculinity studies and textual analysis, David Hansen-Miller explains how the exercise of violence has been concealed and denied by modern society at the same time that it retains considerable power over how we live our lives. He demonstrates how discourses of sexuality and gender, even romantic love, are freighted with the micropolitics of violence. Confronted with such contradictions, audiences are drawn to the cinema where they can see violence graphically restored to everyday life. Popular cinema holds the power to narrate and interpret social forces that have become too opaque, diffuse and dynamic to otherwise comprehend. Through detailed engagement with specific narratives from the last century of popular film - *The Cabinet of Dr. Caligari*, *The Sheik*, *Once Upon a Time in the West*, *Deliverance* - and the pervasive violence of contemporary cinema, Hansen-Miller investigates the manner in which representations can transform our understanding of how violence works.

Product Research Sep 18 2021 7. 1. 1 Background Uncertainty can be considered as the lack of adequate information to make a decision. It is important to quantify uncertainties in mathematical models used for design and optimization of nondeterministic engineering systems. In general, - certainty can be broadly classified into three types (Bae et al. 2004; Ha-Rok 2004; Klir and Wierman 1998; Oberkampf and Helton 2002; Sentz 2002). The first one is aleatory uncertainty (also referred to as stochastic uncertainty or inherent - certainty) – it results from the fact that a system can behave in random ways. For example, the failure of an engine can be modeled as an aleatory uncertainty because the failure can occur at a random time. One cannot predict exactly when the engine will fail even if a large quantity of failure data is gathered (available). The second one is epistemic uncertainty (also known as subjective uncertainty or reducible - certainty) – it is the uncertainty of the outcome of some random event due to lack of knowledge or information in any phase or activity of the modeling process. By gaining information about the system or environmental factors, one can reduce the epistemic uncertainty. For example, a lack of experimental data to characterize new materials and processes leads to epistemic uncertainty.
